

EduGenie – Project Design Phase

Step 3 documentation prepared from the current EduGenie repository description and the requested 8-phase GitHub format.

1. Project Overview

EduGenie is described in the repository as an AI-powered learning assistant built with FastAPI and Google Gemini. The listed functions are asking educational questions, getting simple explanations, summarizing study material, generating quizzes, and creating personalized learning paths.

2. Technology Design

Layer	Technology / role
Application backend	Python + FastAPI
AI service	Google Gemini API
Template layer	Jinja2
Frontend	HTML, CSS, JavaScript

3. Logical Architecture

User → EduGenie web interface → FastAPI application → Google Gemini API → generated educational response. Jinja2 is listed as the template technology, with HTML/CSS/JavaScript used for the interface. This is a logical representation based on the repository's documented technology stack; it is not a claim about undocumented internal modules.

4. Main Functional Areas

Educational question answering; simple explanations; study-material summarization; quiz generation; personalized learning paths.

5. Design Notes

The design should keep the user interaction simple: accept an educational request, send it through the application layer, obtain an AI-generated response, and present the result through the web interface. API credentials should remain outside public source files.
