

EduGenie – Performance Testing

6. Performance Testing

This document defines the testing scope and test cases for checking the expected behavior of the EduGenie application.

1. Testing Scope

Test Area	Expected Result
Application launch	The EduGenie application should start without an application error.
Web interface	The main page should load and the user should be able to interact with the interface.
AI question request	A submitted educational question should be processed and an AI-generated response should be returned.
Study material / input processing	Supported input should be processed according to the implemented application functionality.
Error handling	The application should handle invalid or failed requests without an unexpected crash.
Static resources	Required CSS, JavaScript, and other static resources should load correctly.

2. Testing Approach

Testing should be performed by running the application and checking the above scenarios one by one. The observed result can then be recorded as Pass, Fail, or Needs Review.

3. Performance-Related Checks

Review response behavior, page loading, request handling, error handling, and the loading of required static resources. Actual response-time measurements should be recorded only after the application is tested.

4. Test Result Recording

This document provides the test plan and expected results. It does not claim Pass/Fail results that were not actually measured.

5. Static Folder

The reference project structure includes a static folder under the Performance Testing phase. If project-specific screenshots, test evidence, or related static materials are required there, they can be added separately.
